

# Course Reminders

- Due today (11:59PM)
  - Q1 (covers lectures last week)
- Due this Wednesday (11:59 PM)
  - Pre-course survey
  - Practice Assignment
- Due this Friday (11:59 PM)
  - D1
  - #FinAid quiz on Canvas

# DS3 Fall Kickoff Week

- WED** | Meet the Board 12 - 2 pm, Red Shoe Room ⑪  
10.11 | Fall GBM 6 - 8 pm, PC Ballroom West ⑪
- THU** | Data Science Talent Day 1  
10.12 | 11 - 2 pm, PC Ballroom East
- FRI** | Data Science Talent Day 2  
10.13 | 10 - 12 pm, Virtual  
Cloud Powered Data Science Part 1 ⑪  
3:30 - 4:30 pm, CSE 1202
- SAT** | Bonfire Social ⑪  
10.14 | 4 - 8 pm, La Jolla Shores

⑪ Free Food!!

# Data tidiness & intuition

# Data Structures Review

## Structured data

- can be stored in database SQL
- tables with rows and columns
- requires a relational key
- 5-10% of all data

## Semi-structured data

- doesn't reside in a relational database
- has organizational properties (easier to analyze)
- CSV, XML, JSON

## Unstructured

- non-tabular data
- 80% of the world's data
- images, text, audio, videos

# Structured Data

*Databases!*

*What is a DB?? An organized collection of structured information*

*Manage huge datasets*

*Control access to data*

*Allow users to find a subset of data with a query*

*Run an analysis on data inside the DB and return a report*

# Structured Data

## *Examples of relational DB*

- *SQLite*
- *MySQL*
- *Postgres*

*Relational DB work using tables of data with “relationships” established between tables*

## *Examples of non-relational DB*

- *Hadoop*
- *Hive*
- *Apache CouchBase*

*NoSQL DB work with key-value pairs to lookup data, and that’s exactly like JSON slides coming up.*

# (Semi-)Structured Data

*Data that is stored in such a way that it is easy to search and work with. These data are stored in a particular format that adheres to organization principles imposed by the file format. These are the data structures data scientists work with most often.*

# CSVs

Has the extension  
“.csv”

Each column  
separated  
by a  
comma

Example CSV - Sheet1 — Notatnik

Plik Edycja Format Widok Pomoc

```
Email,First Name,Last Name,Company,Snippet 1
example1@domain.com,John,Smith,Company 1,Snippet Sentence1
example2@gmail.com,Mary,Blake,Company 2,Snippet Sentence 2
example3@outlook.com,James,Joyce,Company 3,Snippet Sentence 3
```

Each row  
is  
separated  
by a new  
line

## Example CSV

File Edit View Insert Format Data Tools Add-ons Help [All changes saved in Drive](#)

# Jupyter notebooks suck to version control

<https://nextjournal.com/schmudde/how-to-version-control-jupyter>

## Clear Output Manually

The simplest solution is to always clear the output before committing. **Cell** → **All Output** → **Clear** → **Save**. This removes any binary blobs that have been generated by the notebook. There are three main drawbacks:

- It is a manual process.
- Collaborators on other machines will need to rerun the notebook to see the output, requiring additional time and setup.

# Jupyter notebooks suck to version control

<https://nextjournal.com/schmudde/how-to-version-control-jupyter>

## ReviewNB

ReviewNB is a GitHub app that also offers visual diffing with an interface that looks similar to the traditional Jupyter IDE. Because the outputs are visualized, problems associated with committing binary blobs disappear.

# Relational Databases: A set of interdependent tables

1. Efficient Data Storage
2. Avoid Ambiguity
3. Increase Data Privacy

A screenshot of a database application window. At the top, there are two tabs: 'Results' and 'Messages'. The 'Results' tab is active, displaying a table with five columns: 'EmployeeId', 'FirstName', 'LastName', and 'DepartmentName'. The table contains 10 rows of data. The first row is highlighted with a dashed border. The data is as follows:

	EmployeeId	FirstName	LastName	DepartmentName
1	1	Ken	Sanchez	Executive
2	2	Terri	Duffy	Engineering
3	3	Roberto	Tamburello	Engineering
4	4	Rob	Walters	Engineering
5	5	Gail	Erickson	Engineering
6	6	Josef	Goldberg	Engineering
7	7	Dylan	Miller	Support
8	8	Diane	Margheim	Support

# Tidy Data

1. Each **variable** you measure should be in a single column

	A	B	C	D	E	F	G
1	ID	LastName	FirstName	Sex	City	State	Occupation
2	1004	Smith	Jane	female	Frederick	MD	Welder
3	4587	Nayef	Mohammed	male	Upper Darby	PA	Nurse
4	1727	Doe	Janice	female	San Diego	CA	Doctor
5	6879	Jordan	Alex	male	Birmingham	AL	Teacher

2. Every **observation** of a variable should be in a different row

	A	B	C	D	E	F	G
1	ID	LastName	FirstName	Sex	City	State	Occupation
2	1004	Smith	Jane	female	Frederick	MD	Welder
3	4587	Nayef	Mohammed	male	Upper Darby	PA	Nurse
4	1727	Doe	Janice	female	San Diego	CA	Doctor
5	6879	Jordan	Alex	male	Birmingham	AL	Teacher

### 3. There should be one table for each type of data

Demographic Survey Data

	A	B	C	D	E	F	G
1	ID	LastName	FirstName	Sex	City	State	Occupation
2	1004	Smith	Jane	female	Frederick	MD	Welder
3	4587	Nayef	Mohammed	male	Upper Darby	PA	Nurse
4	1727	Doe	Janice	female	San Diego	CA	Doctor
5	6879	Jordan	Alex	male	Birmingham	AL	Teacher

Doctor's Office Measurements Data

	A	D	E	F	G
1	ID	Height_inches	Weight_lbs	Insulin	Glucose
2	1004	65	190	0.60	163
3	4587	75	215	1.46	150
4	1727	62	124	0.72	177
5	6879	77	160	1.23	205

4. If you have multiple tables, they should include a column in each *with the same column label* that allows them to be joined or merged

	A	B	C	D	E	F	G
1	ID	LastName	FirstName	Sex	City	State	Occupation
2	1004	Smith	Jane	female	Frederick	MD	Welder
3	4587	Nayef	Mohammed	male	Upper Darby	PA	Nurse
4	1727	Doe	Janice	female	San Diego	CA	Doctor
5	6879	Jordan	Alex	male	Birmingham	AL	Teacher

	A	D	E	F	G
1	ID	Height_inches	Weight_lbs	Insulin	Glucose
2	1004	65	180	0.60	163
3	4587	75	215	1.46	150
4	1727	62	124	0.72	177
5	6879	77	180	1.23	205

# Tidy data == rectangular data

**A**

	A	B	C	D	E
1	Id	sex	glucose	Insulin	triglyc
2	101	Male	134.1	0.60	273.4
3	102	Female	120.0	1.18	243.6
4	103	Male	124.8	1.23	297.6
5	104	Male	83.1	1.16	142.4
6	105	Male	105.2	0.73	215.7

## Tidy Data Benefits

1. consistent data structure
2. foster tool development
3. require only a small set of tools to be learned
4. allow for datasets to be combined

**TIDY** data is **NOT** the same as **CLEAN** data

# Clean Data

Data cleaning is the process of detecting and correcting/  
removing data records that are

- incomplete,
- incorrect,
- inaccurate, or
- irrelevant

and often includes making sure missing data is correctly marked  
and that duplicate records and other errors are removed

Data that is **TIDY** and **CLEAN** is ready for use

In today's pattern recognition class my professor talked about PCA, eigenvectors and eigenvalues.

I understood the mathematics of it. If I'm asked to find eigenvalues etc. I'll do it correctly like a machine. But I didn't **understand** it. I didn't get the purpose of it. I didn't get the feel of it.

I strongly believe in the following quote:

You do not really understand something unless you can explain it to your grandmother. -- Albert Einstein

Well, I can't explain these concepts to a layman or grandma.

1. Why PCA, eigenvectors & eigenvalues? What was the *need* for these concepts?
2. How would you explain these to a layman?

# Data Intuition

# Fermi Estimation

<https://forms.gle/C982naWtU9RvHqAb7>

Approximately how many piano tuners do you think there are  
in the city of Chicago?

# Fermi Estimation

<https://forms.gle/shS84W1tai4SDrVF9>

Has humanity produced enough paint to cover the entire land area of the Earth?

This answer is pretty straightforward. We can look up the size of the world's paint industry, extrapolate backward to figure out the total amount of paint produced. We'd also need to make some assumptions about how we're painting the ground. Note: When we get to the Sahara desert, I recommend not using a brush.

But first, let's think about different ways we might come up with a guess for what the answer will be. In this kind of thinking—often called Fermi estimation—all that matters is getting in the right ballpark; that is, the answer should have about the right number of digits. In Fermi estimation, you can round <sup>[1]</sup> all your answers to the nearest order of magnitude:

Let's suppose that, on average, everyone in the world is responsible for the existence of two rooms, and they're both painted. My living room has about 50 square meters of paintable area, and two of those would be 100 square meters. 7.15 billion people times 100 square meters per person is a little under a trillion square meters—an area smaller than Egypt.

NOT ENOUGH	EXACTLY ENOUGH	MORE THAN ENOUGH
/		

Let's make a wild guess that, on average, one person out of every thousand spends their working life painting things. If I assume it would take me three hours to paint the room I'm in, <sup>[2]</sup> and 100 billion people have ever lived, and each of them spent 30 years painting things for 8 hours a day, we come up with 150 trillion square meters ... just about exactly the land area of the Earth.

NOT ENOUGH	EXACTLY ENOUGH	MORE THAN ENOUGH
/	/	

How much paint does it take to paint a house? I'm not enough of an adult to have any idea, so let's take another Fermi guess.

Based on my impressions from walking down the aisles, home improvement stores stock about as many light bulbs as cans of paint. A normal house might have about 20 light bulbs, so let's assume a house needs about 20 gallons of paint. <sup>[3]</sup> Sure, that sounds about right.

The average US home costs about \$200,000. Assuming each gallon of paint covers about 300 square feet, that's a square meter of paint per \$300 of real estate. I vaguely remember that the world's real estate has a combined value of something like \$100 trillion,<sup>[4]</sup> which suggests there's about 300 billion square meters of paint on the world's real estate. That's about one New Mexico.

NOT ENOUGH	EXACTLY ENOUGH	MORE THAN ENOUGH
//		

Of course, both of the building-related guesses could be overestimates (lots of buildings are not painted) or underestimates (lots of things that are not buildings <sup>[5]</sup> are painted) But from these wild Fermi estimates, my guess would be that there probably isn't enough paint to cover all the land.

So, how did Fermi do?

According to the report [The State of the Global Coatings Industry](#), the world produced 34 billion liters of paints and coatings in 2012.

There's a neat trick that can help us here. If some quantity—say, the world economy—has been growing for a while at an annual rate of  $n$ —say, 3% (0.03)—then the most recent year's share of the whole total so far is  $1 - \frac{1}{1+n}$ , and the whole total so far is the most recent year's amount times  $1 + \frac{1}{n}$ .

If we assume paint production has, in recent decades, followed the economy and grown at about 3% per year, that means the total amount of paint produced equals the current yearly production times 34.<sup>[6]</sup> That comes out to a little over a trillion liters of paint. At 30 square meters per gallon,<sup>[2]</sup> that's enough to cover 9 trillion square meters—about the area of the United States.

So the answer is no; there's not enough paint to cover the Earth's land, and—at this rate—probably won't be enough until the year 2100.

# Data Intuition

1. Think about your question and your expectations
2. Do some Fermi calculations (back of the envelope calculations)
3. Write code & look at outputs <- think about those outputs
4. Use your gut instinct / background knowledge to guide you
5. Review code & fix bugs

On your own (meaning w/o Googling), please fill out quickly:

Diagram, from the tabular values.

*Vox Populi*

# The Wisdom of the Crowds

- Diversity of opinion: Each person should have private information....even if it's just an eccentric interpretation of the known facts
- Independence: People's opinions aren't determined by the opinions of those around them
- Decentralization: People are able to specialize and draw on local knowledge
- Aggregation: Some mechanism exists for turning private judgements into a collective decision
